## Cancer mod class

- Explanation: for some prime modulo  $p$ , maintains numbers of form  $p^x * y$ , where  $y$  is a nonzero remainder

mod  $p$

- Be careful with calling `Cancer(x, y)`, it doesn't fix the input if  $y > p$

```

1 struct Cancer {
2     ll x; ll y;
3     Cancer() : Cancer(0, 1) {}

5         x = 0, y = _y;
